- Deformações no plano

$$\epsilon_{x'} = \frac{\epsilon_x + \epsilon_y}{2} + \frac{\epsilon_x - \epsilon_y}{2} \cos(2\theta) + \frac{\gamma_{xy}}{2} \operatorname{sen}(2\theta)$$

$$\epsilon_{y'} = \frac{\epsilon_x + \epsilon_y}{2} - \frac{\epsilon_x - \epsilon_y}{2} \cos(2\theta) - \frac{\gamma_{xy}}{2} \operatorname{sen}(2\theta)$$

$$\frac{\gamma_{x'y'}}{2} = - \left(\frac{\epsilon_x - \epsilon_y}{2} \right) \operatorname{sen}(2\theta) + \frac{\gamma_{xy}}{2} \cos(2\theta)$$

- Deformações principais

$$\operatorname{tg}(2\theta_p) = \frac{\gamma_{xy}}{\epsilon_x - \epsilon_y} \quad (1)$$

$$\epsilon_{1,2} = \frac{\epsilon_x + \epsilon_y}{2} \pm \sqrt{\left(\frac{\epsilon_x - \epsilon_y}{2}\right)^2 + \left(\frac{\gamma_{xy}}{2}\right)^2} \quad (2)$$

- Mesma metodologia do EPT

$$(\epsilon_{x'} - \epsilon_{\text{méd}})^2 + \left(\frac{\gamma_{x'y'}}{2}\right)^2 = R$$

$$\epsilon_{\text{méd}} = \frac{\epsilon_x + \epsilon_y}{2} \quad R = \sqrt{\left(\frac{\epsilon_x - \epsilon_y}{2}\right)^2 + \left(\frac{\gamma_{xy}}{2}\right)^2}$$

● Extensômetros e Rosetas de deformação

$$\epsilon_a = \epsilon_x \cos^2 \theta_a + \epsilon_y \sin^2 \theta_a + \gamma_{xy} \sin \theta_a \cos \theta_a$$

$$\epsilon_b = \epsilon_x \cos^2 \theta_b + \epsilon_y \sin^2 \theta_b + \gamma_{xy} \sin \theta_b \cos \theta_b$$

$$\epsilon_c = \epsilon_x \cos^2 \theta_c + \epsilon_y \sin^2 \theta_c + \gamma_{xy} \sin \theta_c \cos \theta_c$$

- **Crítérios de falha materiais dúteis**
- **Crítério da Máxima Tensão Cisalhanete (Crítério de Tresca)**

$$\tau_{\max} = \text{MAX} \left[\left| \frac{\sigma_1 - \sigma_3}{2} \right|, \left| \frac{\sigma_2 - \sigma_3}{2} \right|, \left| \frac{\sigma_1 - \sigma_2}{2} \right| \right] \leq \frac{\sigma_e}{2}$$

- **Critério de Von Mises**

$$(\sigma_1 - \sigma_2)^2 + (\sigma_2 - \sigma_3)^2 + (\sigma_3 - \sigma_1)^2 \leq 2\sigma_e^2$$

- **Tensão de Von Mises**

$$\sigma_{vm} = \sqrt{\frac{(\sigma_1 - \sigma_2)^2 + (\sigma_2 - \sigma_3)^2 + (\sigma_3 - \sigma_1)^2}{2}} \leq \sigma_e$$

- Critério de falha materiais frágeis

$$\sigma_{max} \leq k_t = \sigma_u \text{ tração}, \quad \sigma_{min} \geq k_t = \sigma_u \text{ compressão}$$

- **Fator de segurança**

- $FS > 1$ para tensão admissível de projeto

- Materiais dúteis $\Rightarrow \sigma_{adm} = \frac{\sigma_e}{FS}$

- Materiais frágeis $\Rightarrow \sigma_{adm} = \frac{\sigma_{ultima}}{FS}$

● Flambagem e instabilidade de Colunas

$$P_{cr} = \frac{\pi^2 E \cdot I}{(KL)^2}$$
